

# HOW DOES ASD® ENSURE QUALITY?

- Poor Project Management
- Delay by Others
- Late Materials
- Building Access
- Lack of Manpower
- Other

BICSI recently did a study on why cabling projects fail. The number one reason was poor project management, followed by lack of manpower and building access. Other problems that hurt projects include lack of communication and unskilled technicians.

Since ASD joined the industry almost 30 years ago we have developed systems and processes to combat these common pitfalls. Below are the ways ASD ensures quality and delivers successful projects time and time again.

## 1 PROJECT MANAGERS

Many of our PMs started in the field and are professionally trained, holding PMP or BICSI certifications. They are here to help and want your project to succeed.

Every project is assigned an experienced project manager, regardless of scope. We know how important a good project manager is, that's why **our average PM has 16 years of experience** in the industry. Their tenure, and the tools and process we have in place for them, ensure superior service and quality on every project.

# 2 AASDIS

We have a network of reliable and certified technicians called Authorized ASD Installers (AASDIs). There are over 12,000 technicians across the United States who are ready to work. Our detailed database has all of their information including licensing, insurance, background checks, and ratings based on previous experiences.

This allows us to find **the best technicians for every project** and because they're local they can get to sites faster and without excessive travel costs.

# 3 MOBILE APP

The AASDI mobile app allows for **real-time project updates**. Technicians can communicate with PMs, check in/out of sites, submit deliverables, and more with the click of a button.

Minimizes time on site.

Reduces the number of trips.

Confirms quality of deliverables.
